REVIEW.

INSIGHT.

OUTLOOK.

We know each other from television...

IBAK products may operate out of sight, but their success is clearly visible. Users all over the world use the innovative sewer inspection systems of the market leader from Kiel. So we have no reason to hide our light under a bushel.

IBAK were the inventors

When the company founder Helmut Hunger started his own business called "Ingenieur Büro Atlas Kiel" in 1945 he was not thinking in global dimensions. His approach was to develop perfectly functioning precision products. An approach which we still follow today with passion. The emphasis has always been on innovative, user-oriented solutions. So it is no accident that it was IBAK who invented sewer television in 1957.

Face to face with the customers

Products from IBAK are technical masterpieces. This is no wonder because one in six of our staff of more than 200 work in the field of research and development.

The long years of experience of our engineers, the constant exchange of ideas between us and our customers and good co-operation with universities and professional bodies ensure the use of future-oriented technologies and their practical implementation. The result: in spite of all the high tech, IBAK systems are high-performance, user-friendly, durable and low-maintenance.

Quality prevails

All IBAK products have one thing in common: they are made in Germany. So all system components, hardware and software are developed, manufactured, assembled and tested by IBAK.

Relevant standards such as ISO, DIN, all applicable CE directives and an ATEX and IECEx-certified quality assurance system only represent our minimum requirements.

You can reckon with IBAK

Because of their high standard of quality, IBAK products are always a safe investment. In spite of all the outstanding product properties, the economical aspect plays a decisive role.

Eco? Logical!

In addition to a strict environmental management system to preserve natural resources being implemented in all divisions of IBAK, our inspection systems also make their own contribution to the protection of the environment. Our systems detect damage in drinking water and sewage pipes and thus help to preserve the precious asset of drinking water for the future.

The special inspection feeling

When we speak of innovations, the digital sewer inspection system PANORAMO obviously gets first mention. It makes travelling through the underground world an extra special 3D experience. The analysis of the entire inspection data takes place in the office in ergonomically comfortable conditions - and not, as is otherwise usual, on site in the inspection van. And it makes you feel as if you are really working with a pan and rotate camera in a pipe.
